ANSYS Inc.

Contradicting Design Requirements

- Cost
- Performance & safety
- **Quality**
- Time to market & short life cycle
- Environmental impacts
- Wow Aesthetics (creating waves of lust for the product, I got to have it ...)
- Major Changes in Industry's Business Model

Changes in Automotive Industry's Business Model

- Cycle development time from concept to production is being compressed significantly
 - 1992: 60 months
 - 1996: 48 months
 - 2000: 18 months
- Vehicle designs are tailored to focused markets
- Vehicles are being manufactured more on a global scale
- Vehicles designed increasingly through multiple engineering sites around the world
- Need for enabling companies throughout the supply chain and extended enterprise to share information through a web-centric visualization approach

Quality - Robust Design

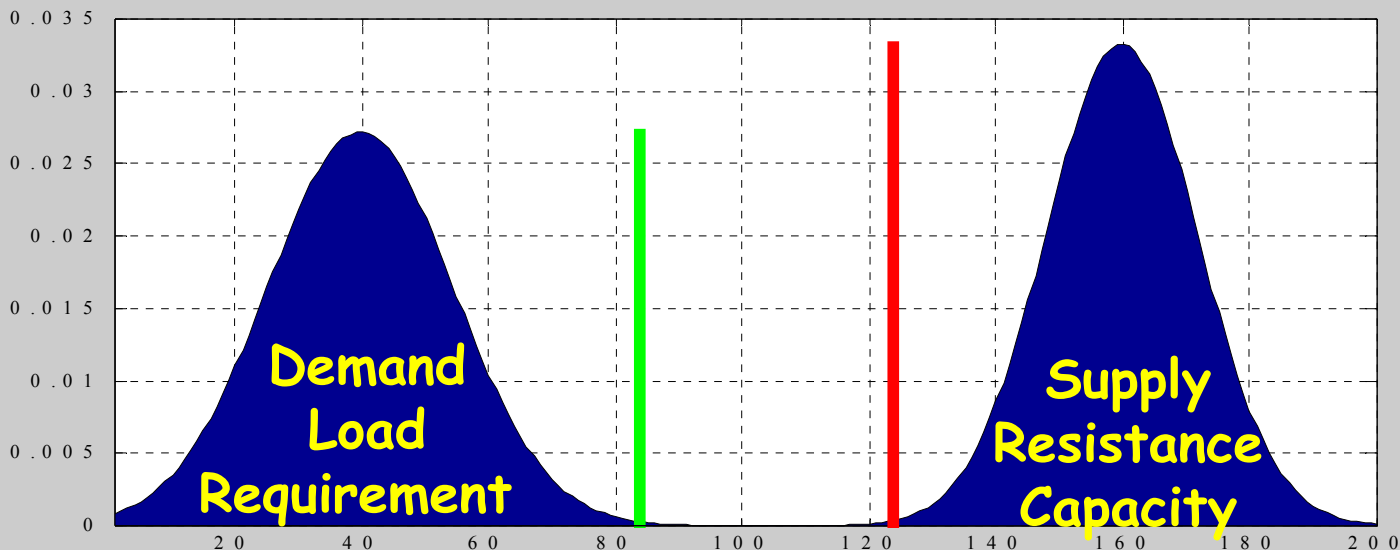

- **Definition of Robust Design:**
Deliver customer expectations at profitable cost regardless of:
 - customer usage
 - variation in manufacturing
 - variation in supplier
 - variation in distribution, delivery & installation
 - degradation over product life
- **Goals of Robust Design (shift and squeeze)**
 - Shift performance mean to the target value
 - Reduce product's performance variability

Traditional Deterministic Approach

- Accounts for uncertainties through the use of empirical Safety factors:
 - Are derived based on past experience
 - Do not guarantee safety or satisfactory performance
 - Do not provide sufficient information to achieve optimal use of available resources

Statistical Design Performance Simulation

*" Product quality requires managerial, technological and **statistical** concepts throughout all the major functions of the organization ..."*

Josheph M. Juran

Variation (thickness, properties, surface finish, loads, etc.) is ... ***THE ENEMY***

DOE, Six Sigma, Statistical FEA, Behavioral Modeling ... ***THE DEFENCE***

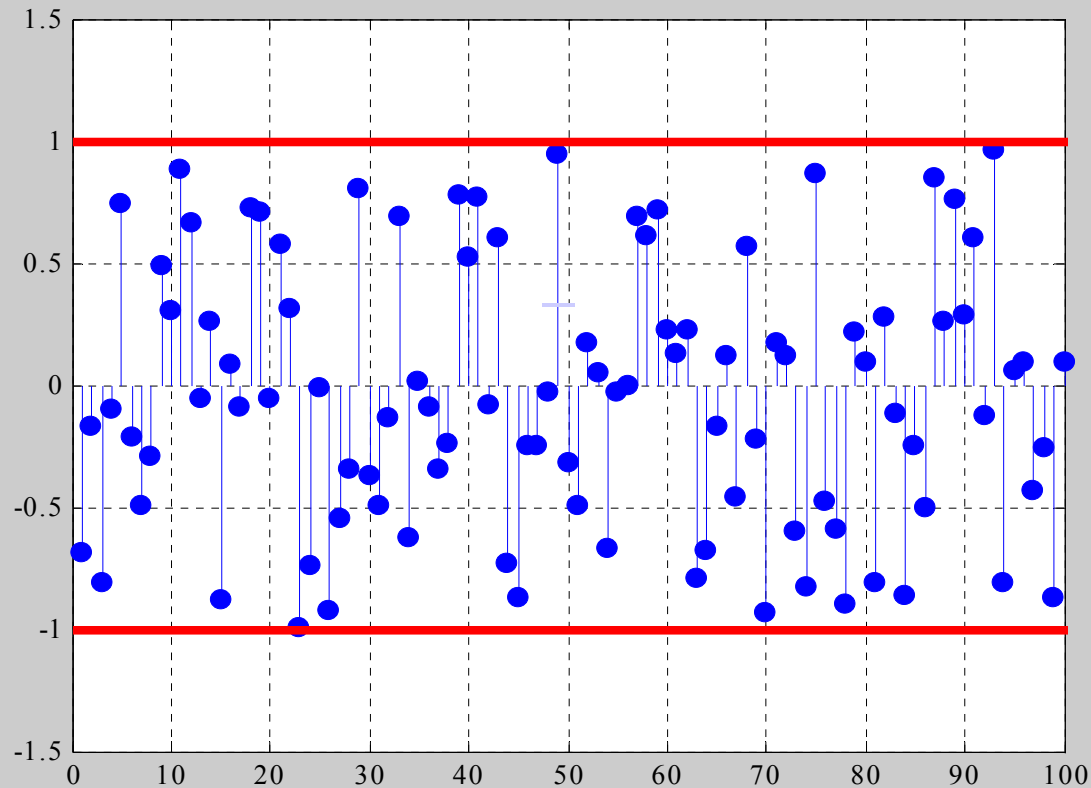

Tools for Robust Design

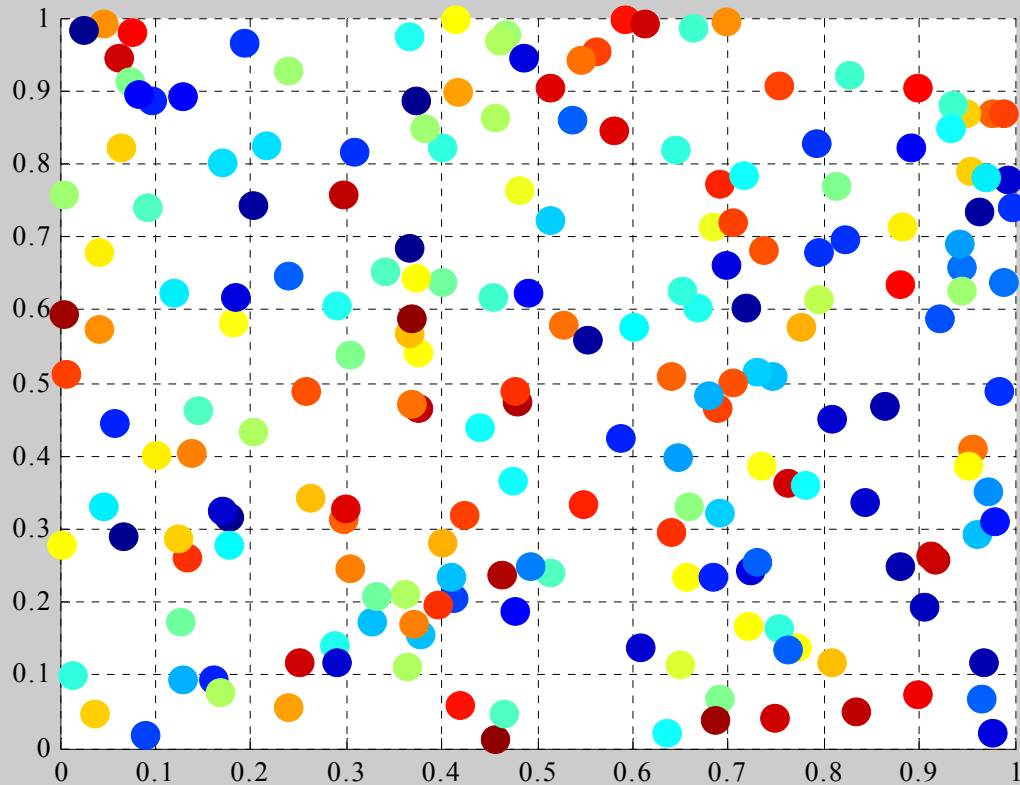

- Design Of Experiments (DOE)
 - Exploits nonlinearities and interactions between noise & control parameters to reduce product performance variability
 - full factorial, fractional factorial, Monte-Carlo, LHC
- Response Surface Methods
 - Central Composite Design
 - Box-Behnken Design
- 6-sigma design (Statistical Performance)
 - Identifying & qualifying causes of variation
 - Centering performance on specification target
 - Achieving Six Sigma level robustness on the key product performance characteristics with respect to the quantified variation

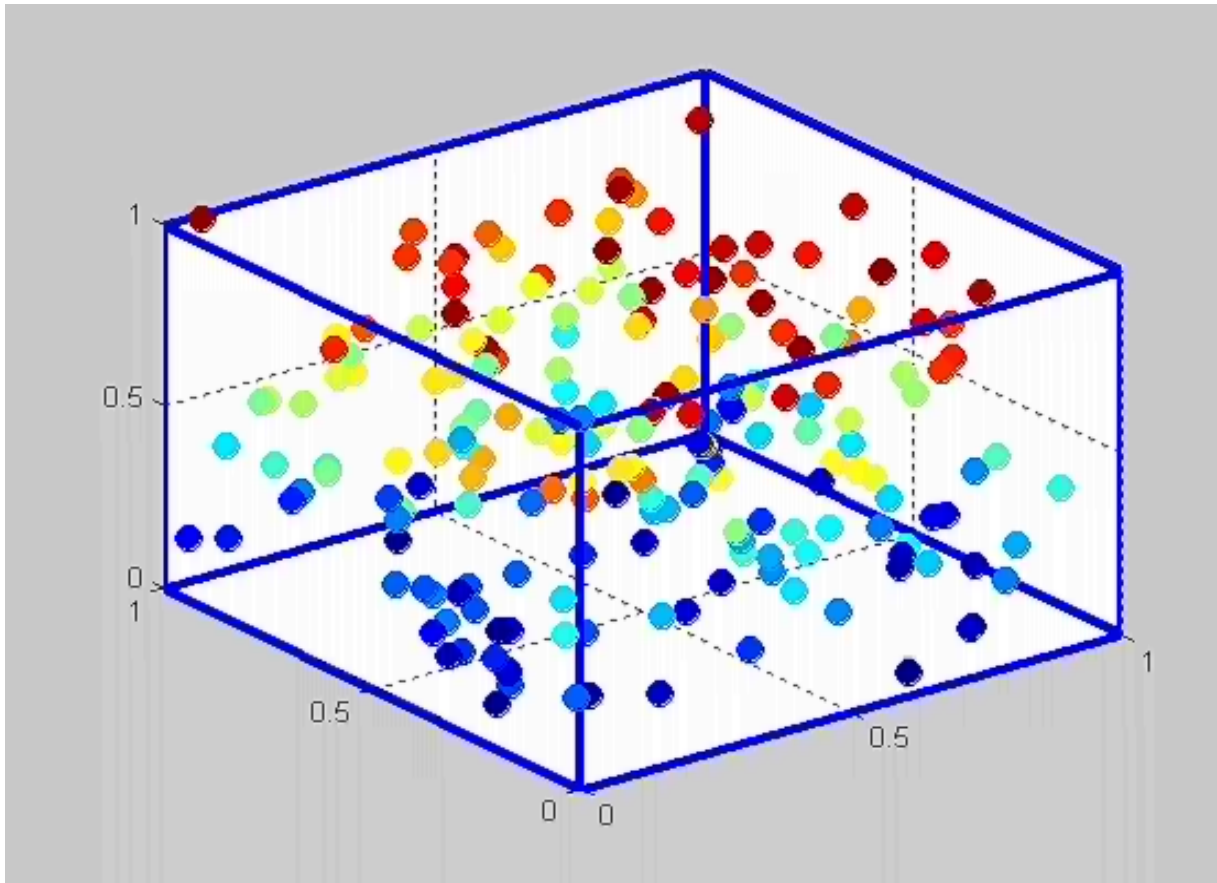

Design Space Exploration 1 Variable

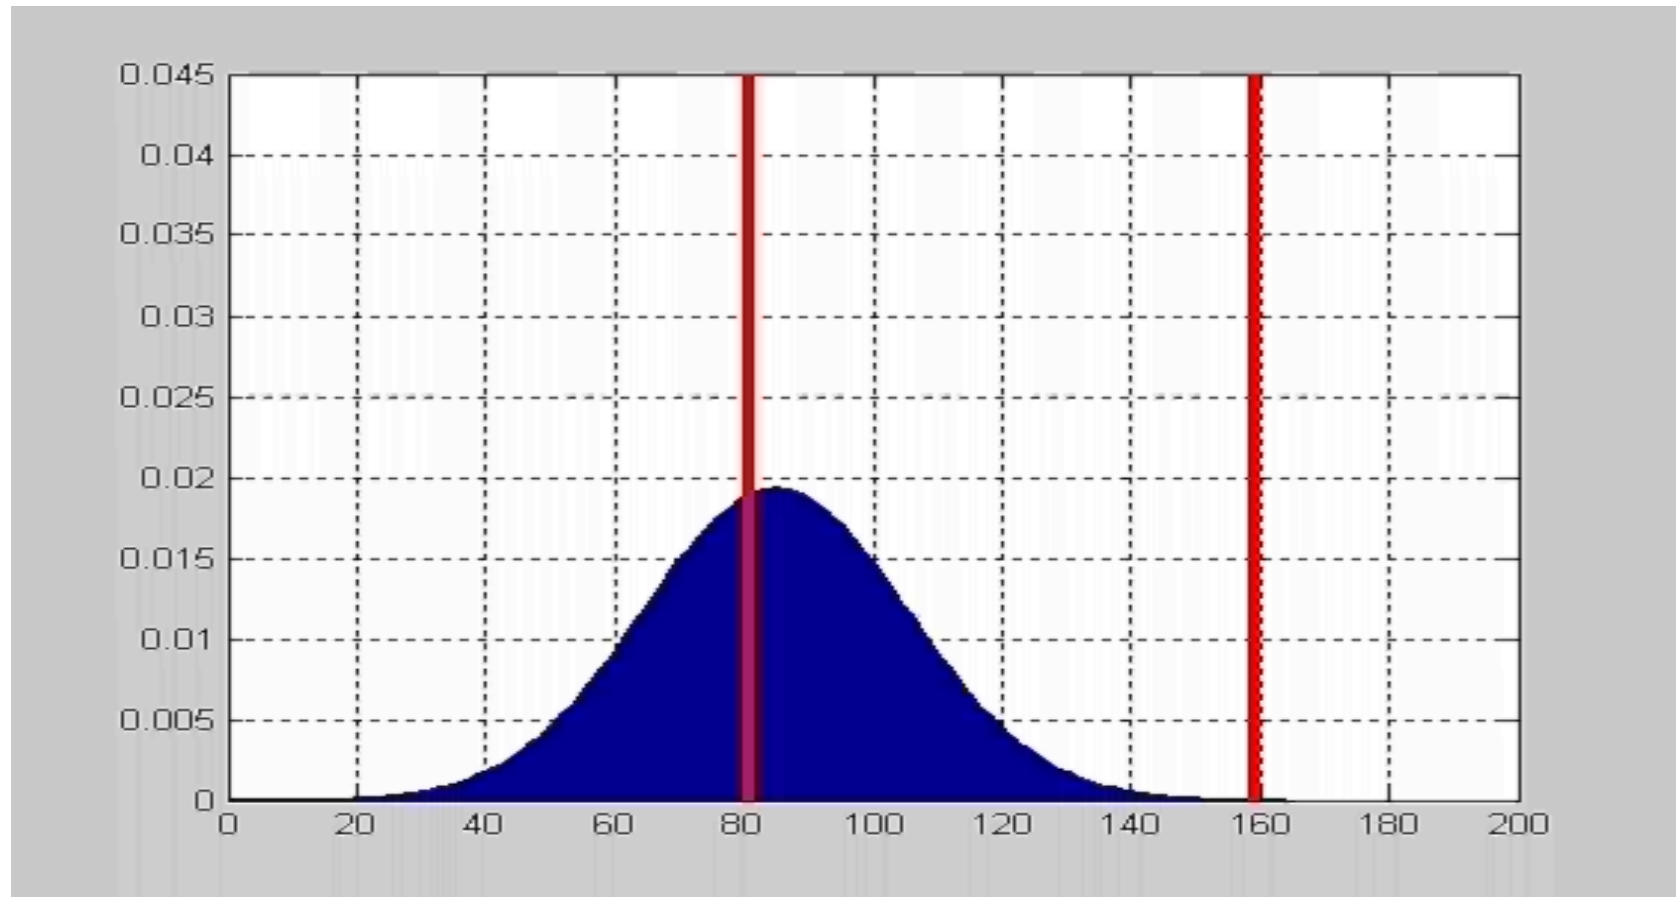

Design Space Exploration 2 Variables

Design Space Exploration 3 Variables

Statistical Performance: Shift and Squeeze

Improved Quality reduced Total Cost

Cost of Defect or Failure

- Lost Customers
- Liability
- Recalls
- Rework

Examples:

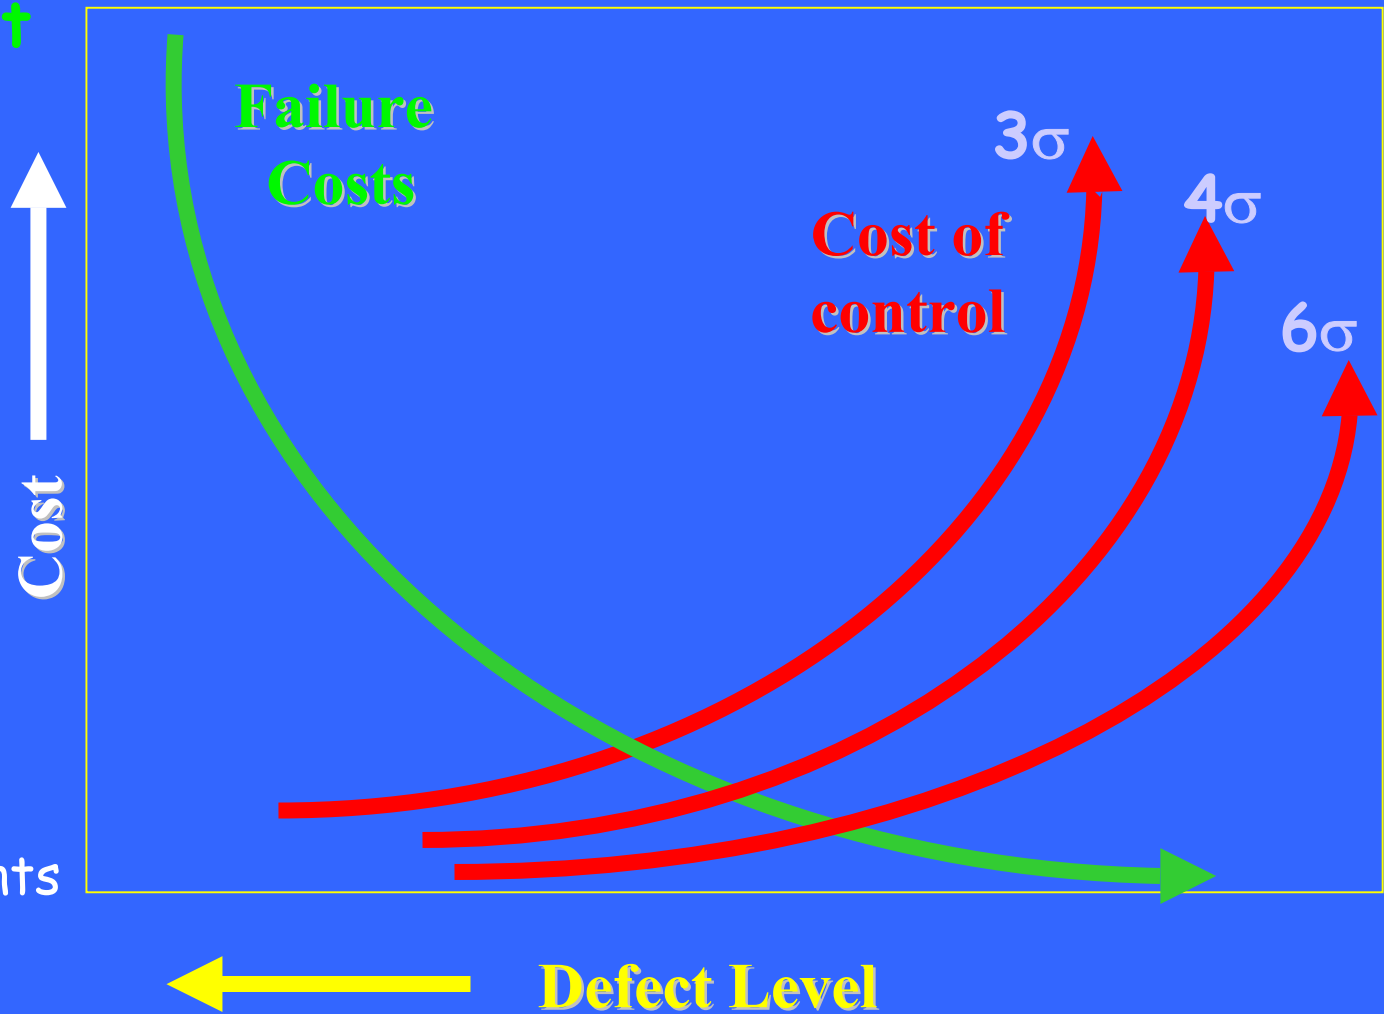

Titanic

Asbestos

Breast Implants

Bhopal, India

...

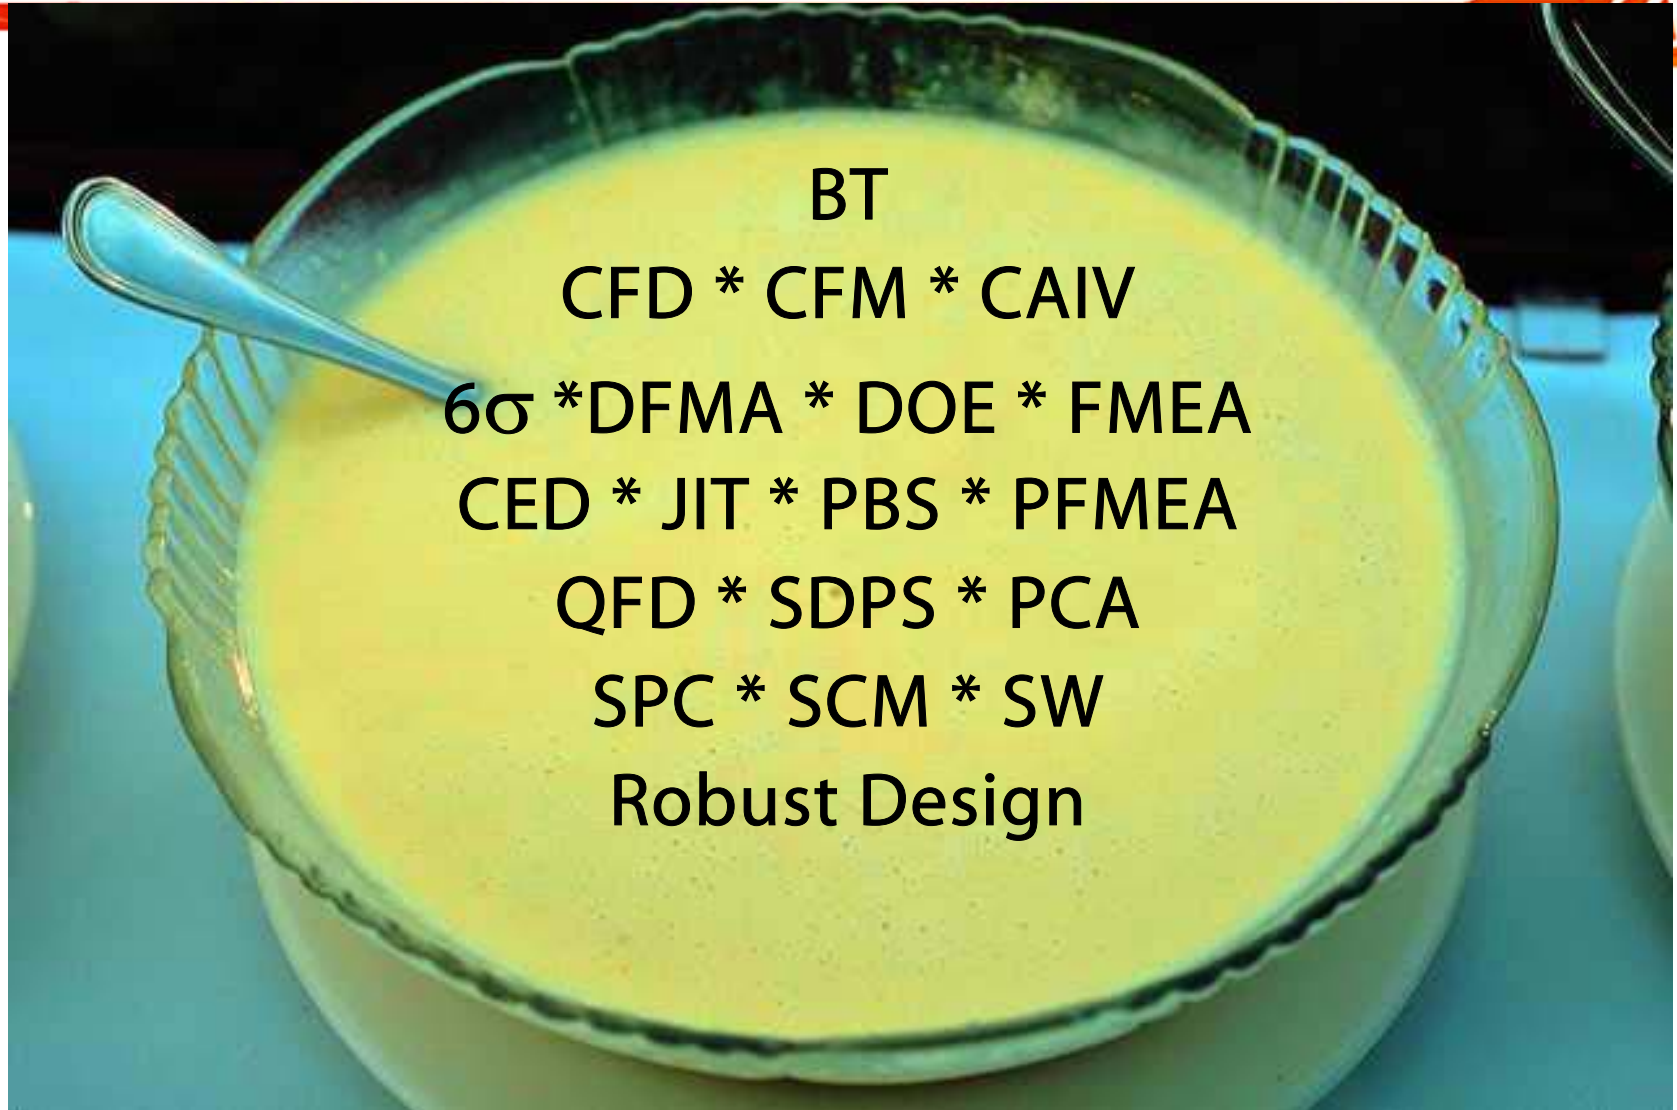

Elements of Quality Management Process

- Agile Improvement Process
- Axiomatic Design
- Benchmarking & Bench-trending
- Catch-ball
- Cellular Manufacturing
- Continuous Flow Development
- Continuous Flow Manufacturing
- Cycle Time Management
- Defect Reduction
- Design for Manufacturing and Assembly
- Design of Experiments
- Failure Modes effects Analysis
- Cause and Effect Diagrams
- Just In Time
- Performance Based Specifications
- Process Failure Mode Effects Analysis
- Quality Function Deployment
- Robust Design
- Self-Directed Work Teams
- Statistical Design Performance Simulation
- Process Capability Analysis
- Statistical Process Control
- Supply Chain Management
- Synchronous Workshops
- Theory of Constraints
- Thinking Process Reality Trees
- Total Productive Maintenance

Elements of Quality Process: The alphabet soup

BT

CFD * CFM * CAIV

6 σ * DFMA * DOE * FMEA

CED * JIT * PBS * PFMEA

QFD * SDPS * PCA

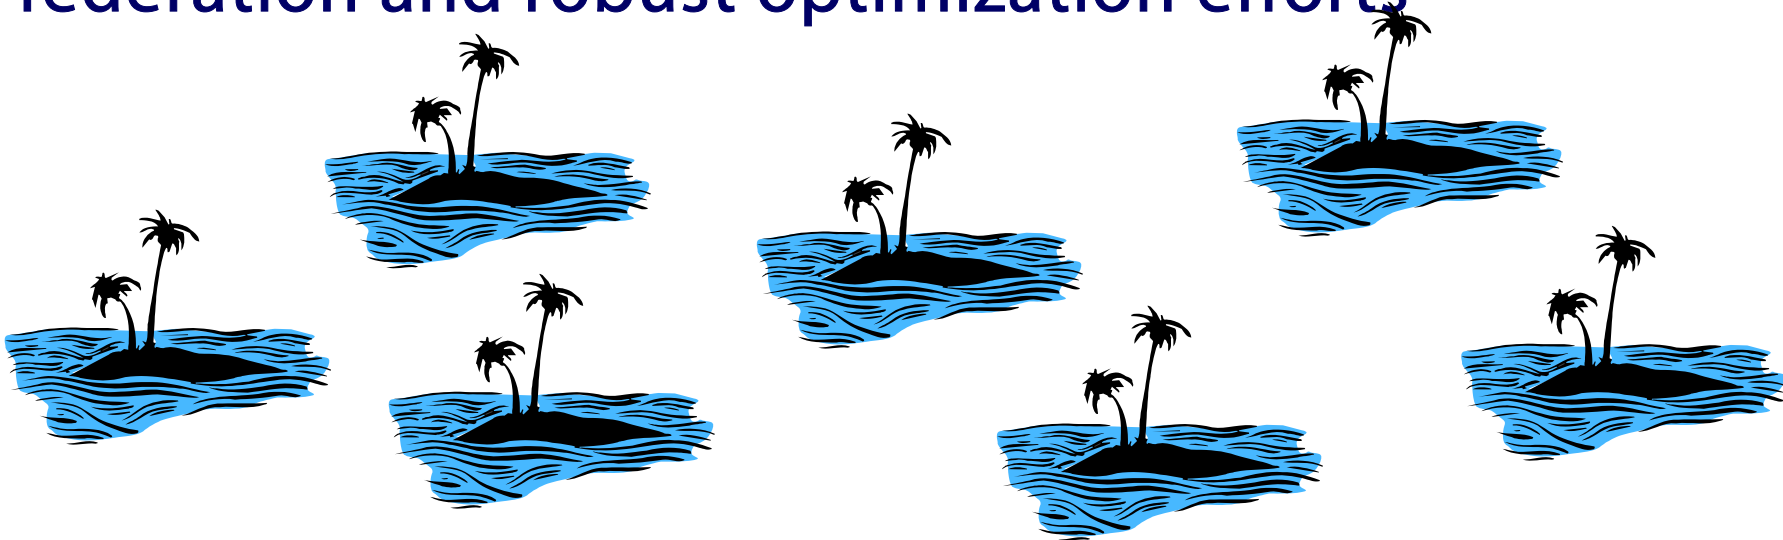

SPC * SCM * SW

Robust Design

Elements of Quality Management Process

- Although all the elements of quality management process are closely connected they remain apart because they have been developed independently from each other
- Integration of these tools is critical to the organization and necessary for successful federation and robust optimization efforts

Identifying Noise & Control Parameters

- **Noise parameters:**

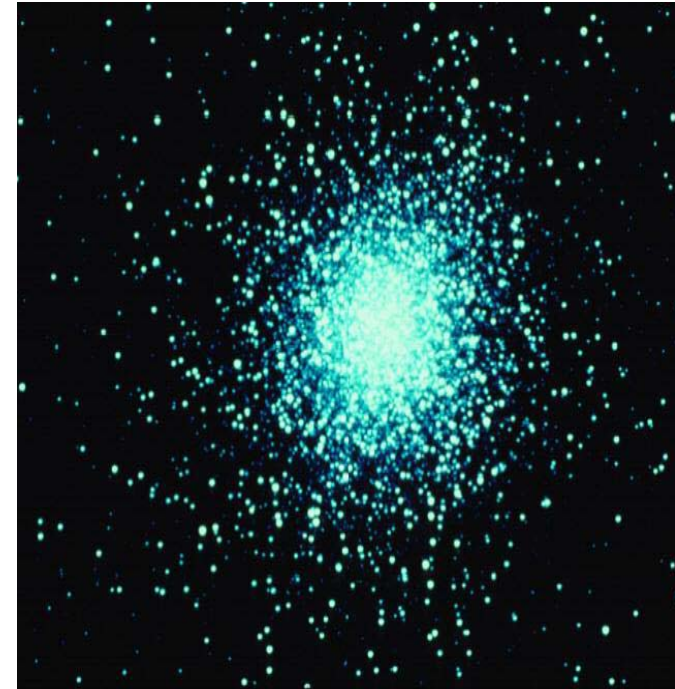

Factors that are beyond the control of the designer

- material property variability
- manufacturing process limitations
- environment temperature & humidity
- component degradation with time
- ...

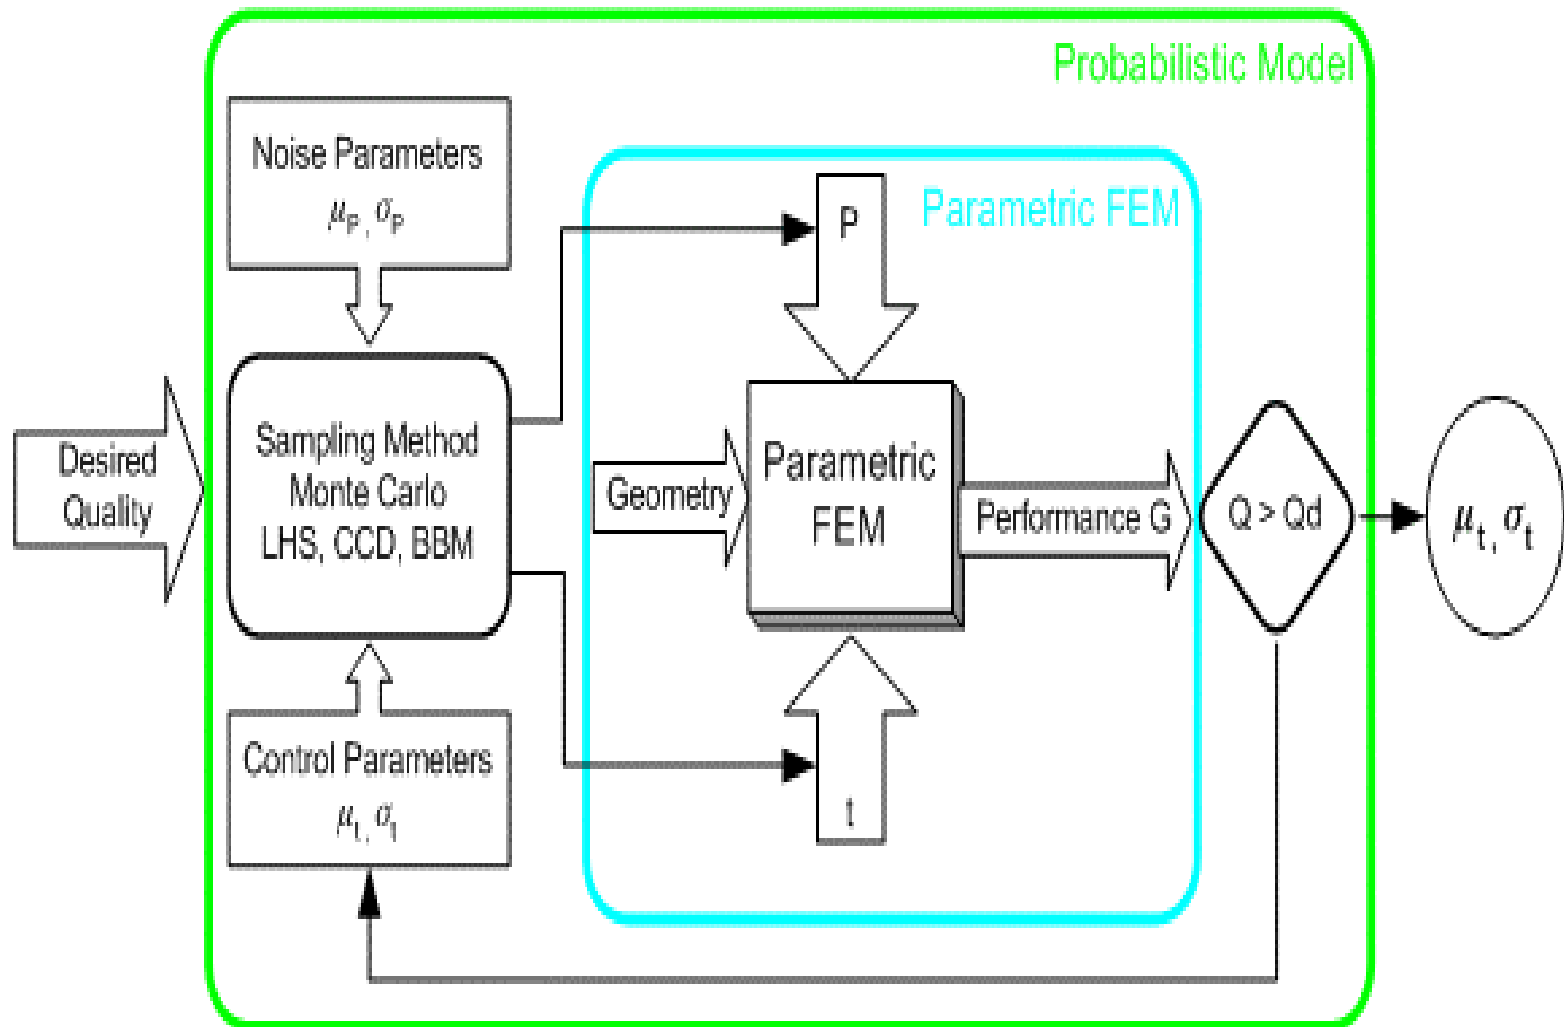

- **Control Parameters:**

Factors that the designer can control

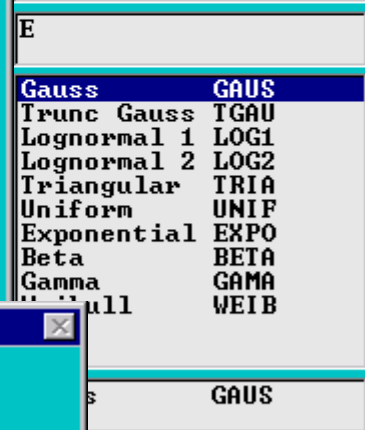

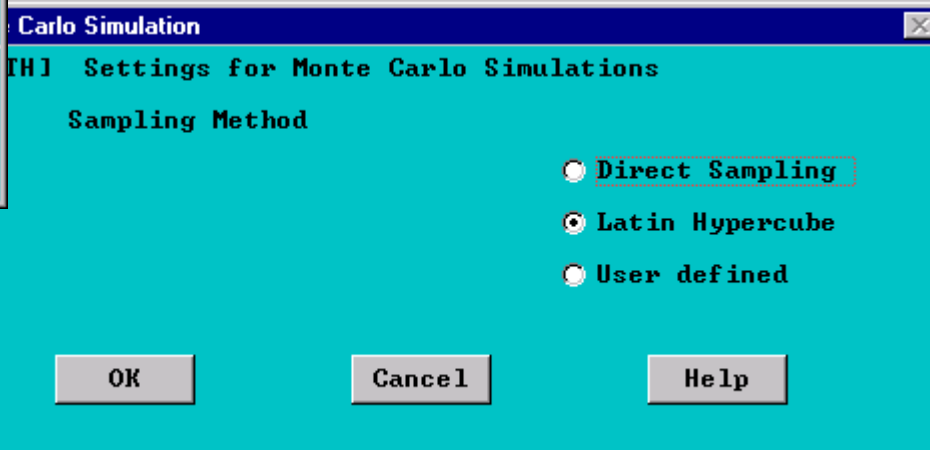

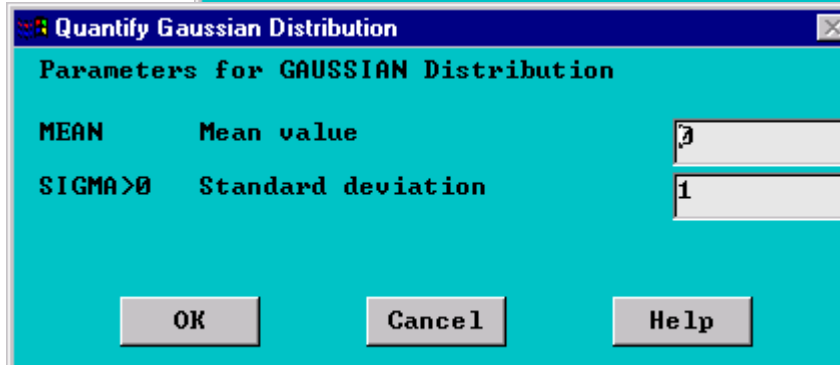

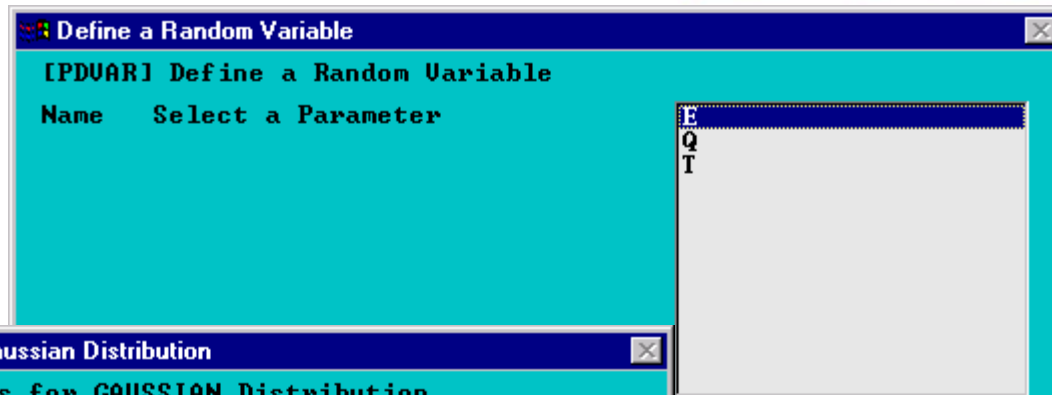

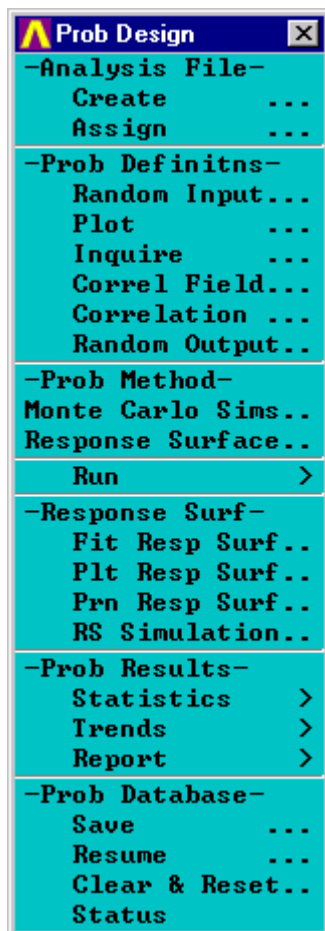

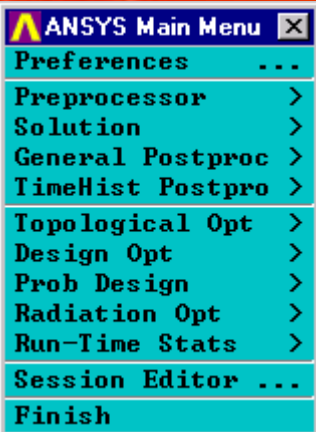

- geometric design variables
- material selections
- design configurations
- manufacturing process settings
- ...

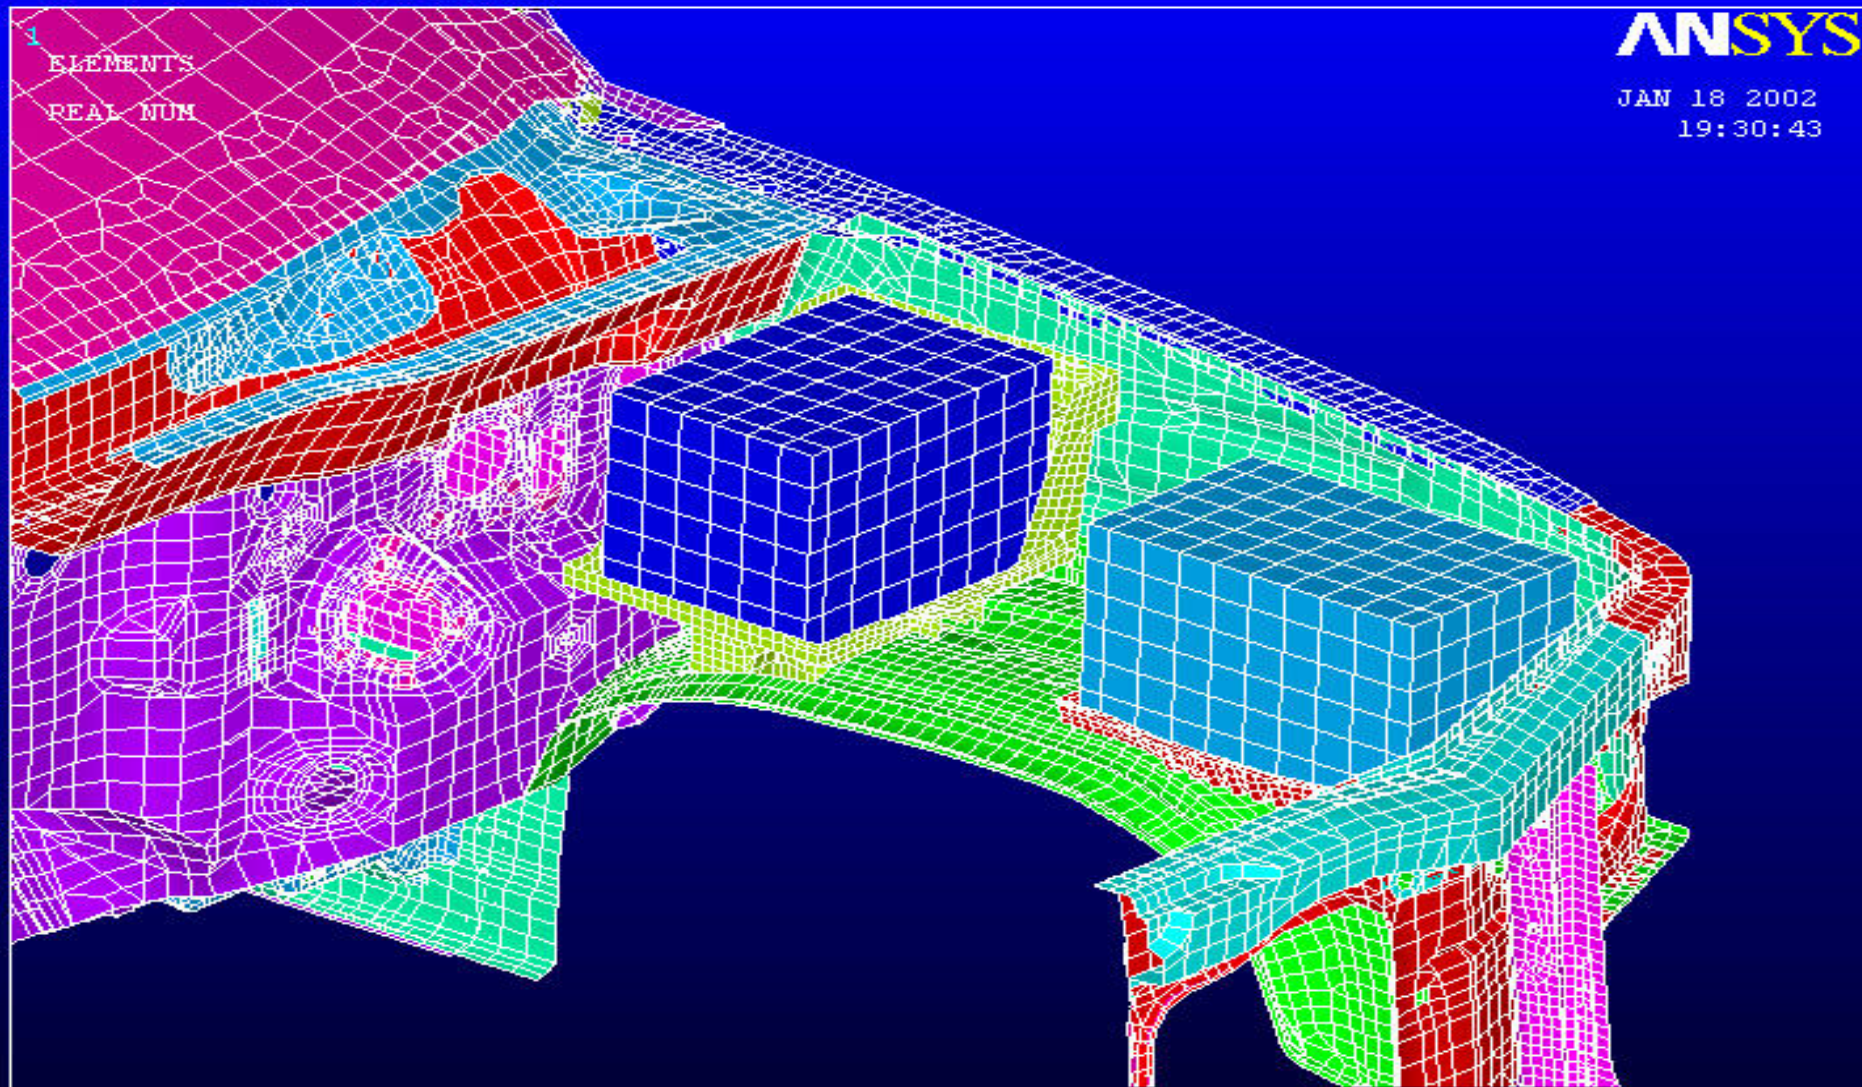

Workflow for Probabilistic Design System

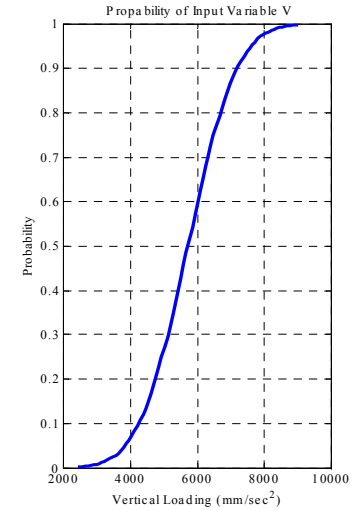

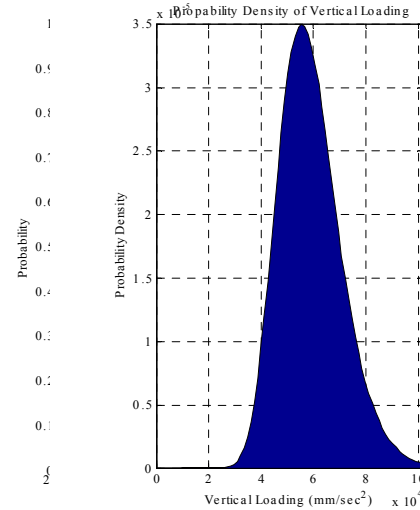

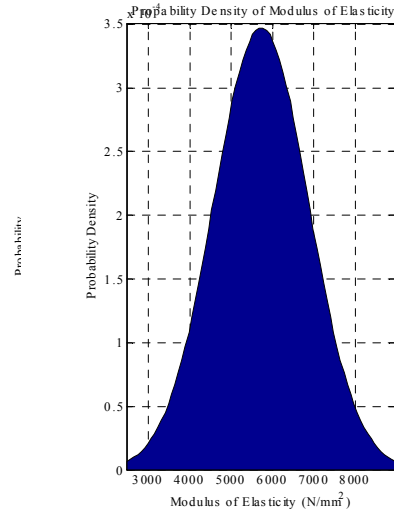

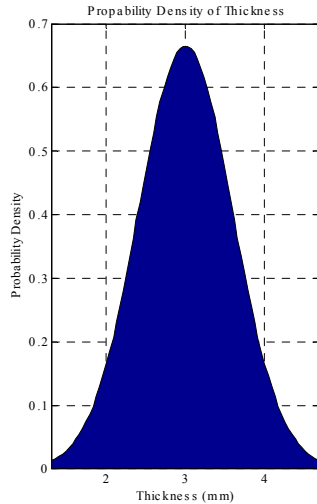

Probabilistic Analysis setup within ANSYS is SIMPLE

Automotive Example

Probability Distributions of input and output variables

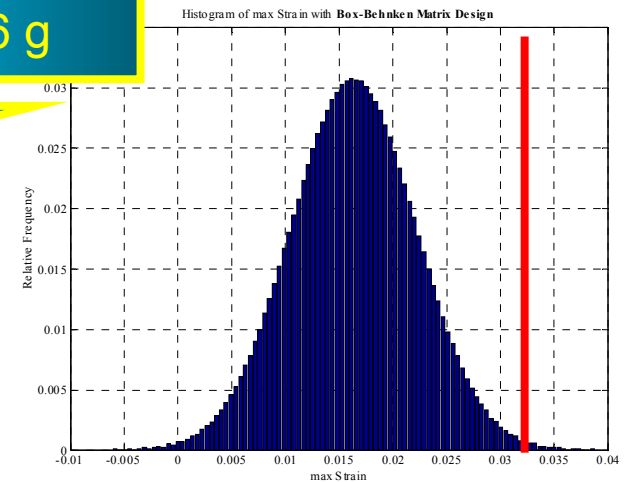

Thickness (3.8-4.2)

Modulus E

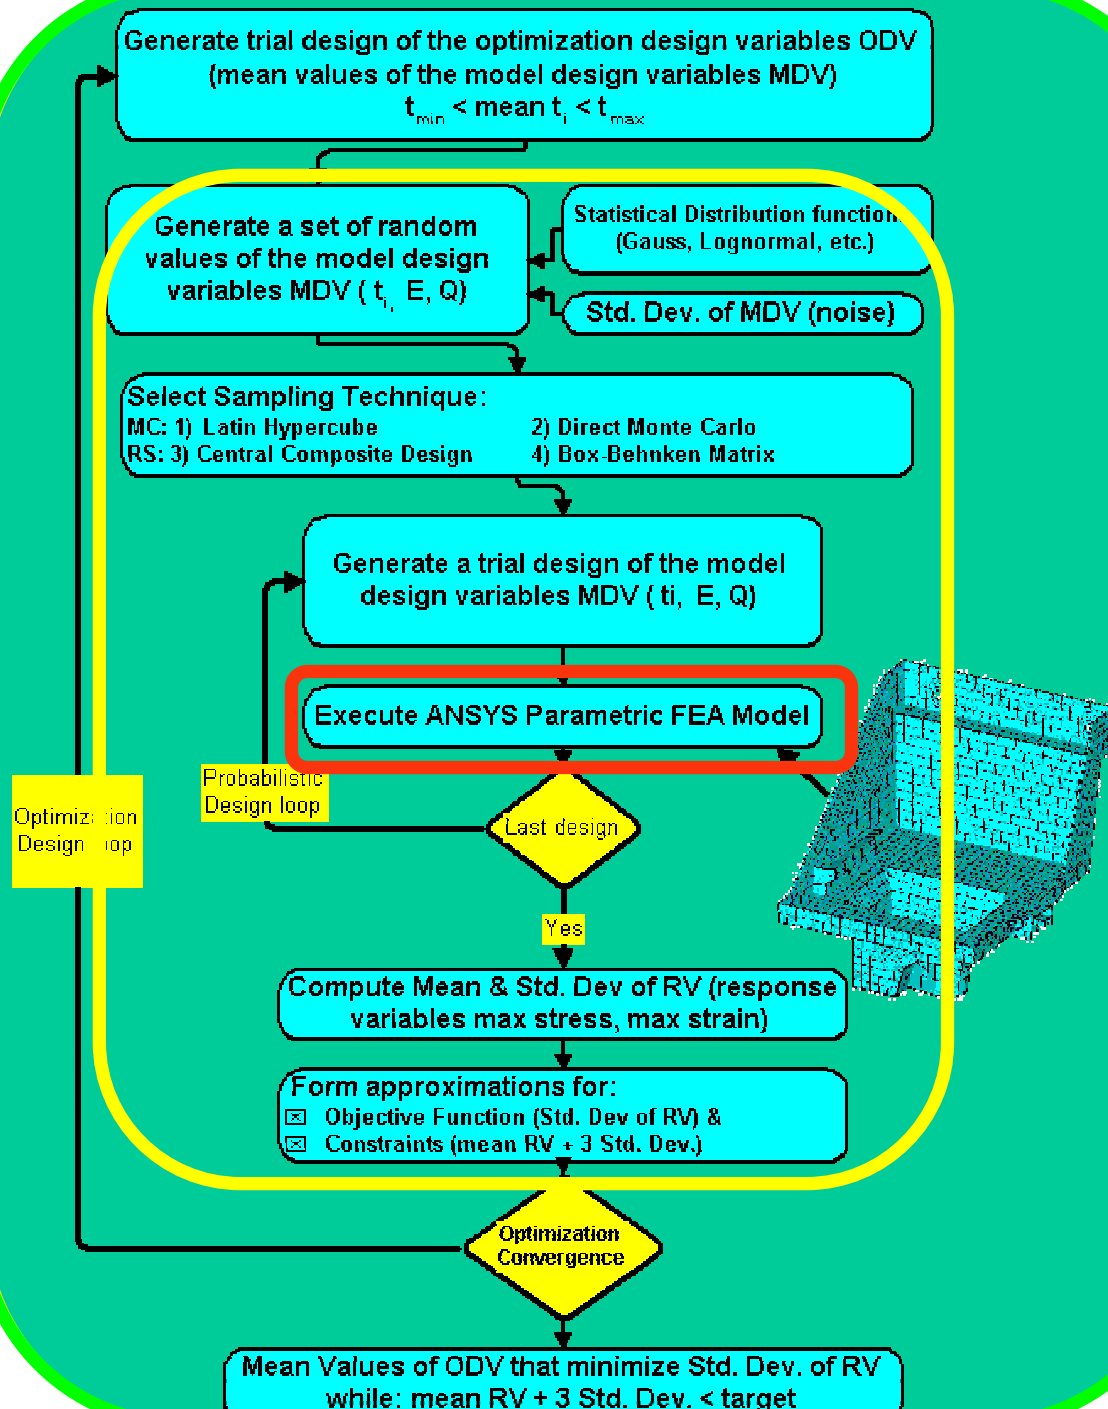

Loading 6 g

Probabilistic Design Loop

Workflow

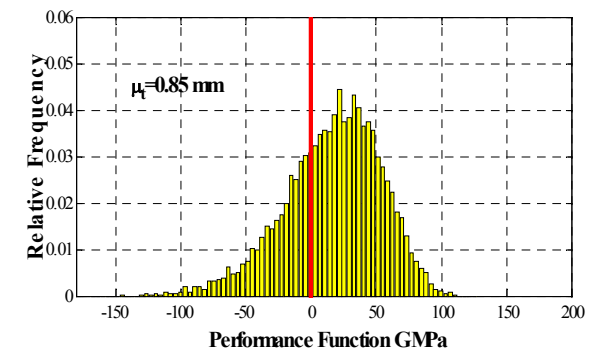

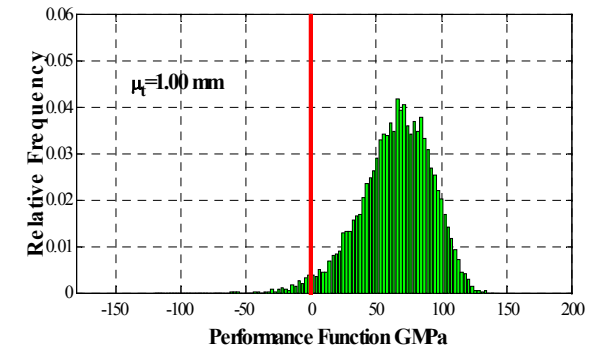

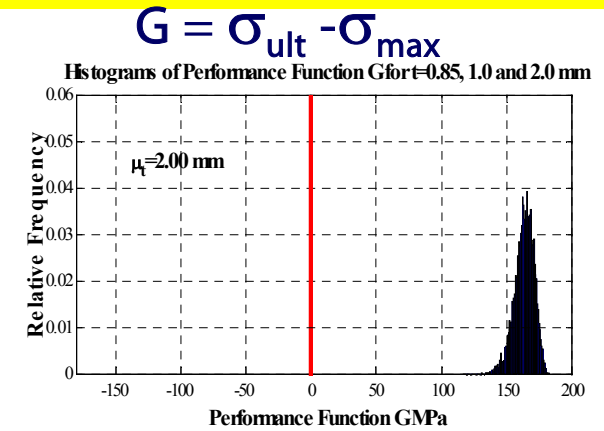

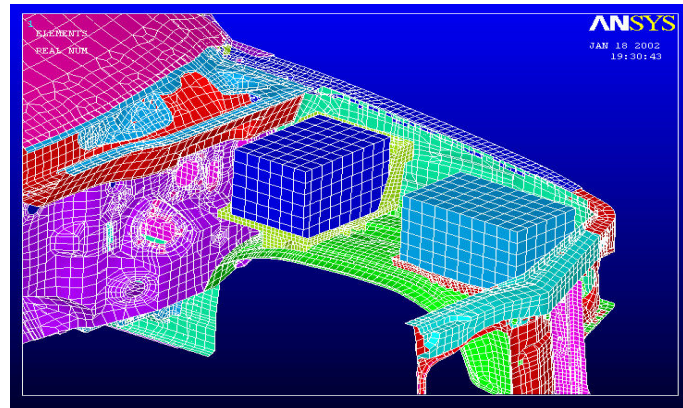

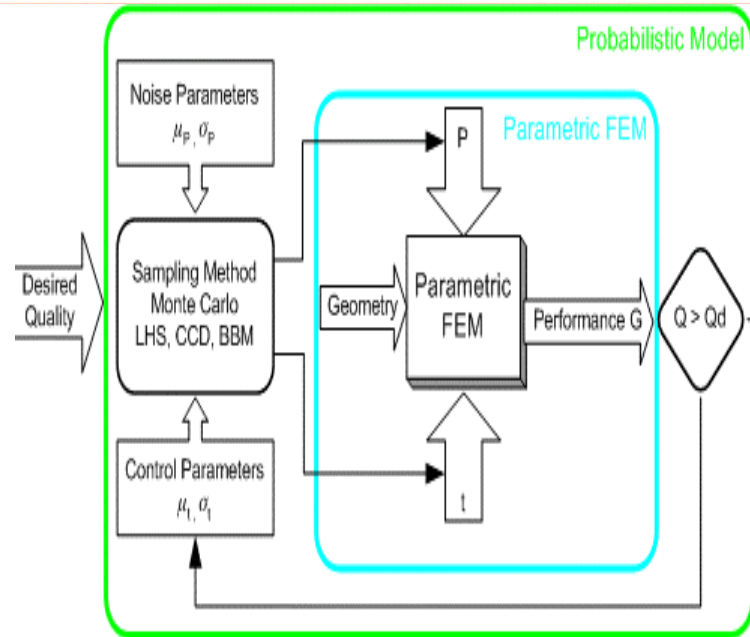

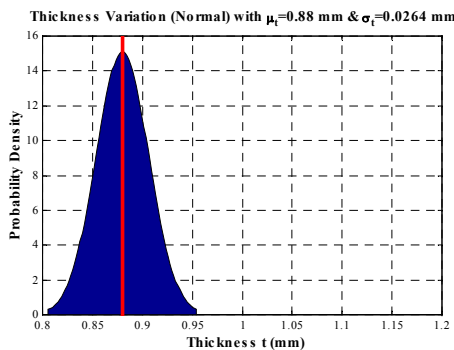

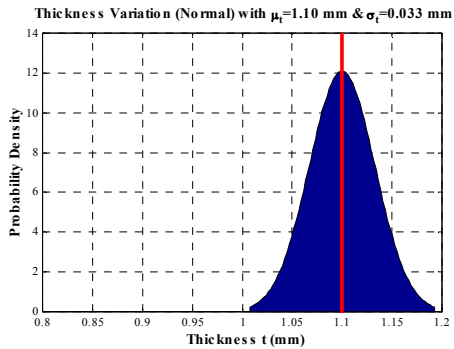

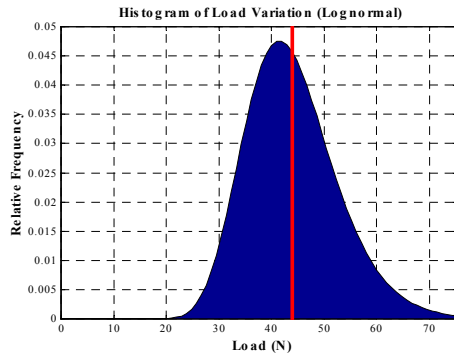

Automatic, No Manual iteration:
CAD -> Meshing -> FEA

Probabilistic Design Loop

Optimization Loop with reliability constraints

Deterministic Optimum designs could lead to unreliable or even catastrophic designs

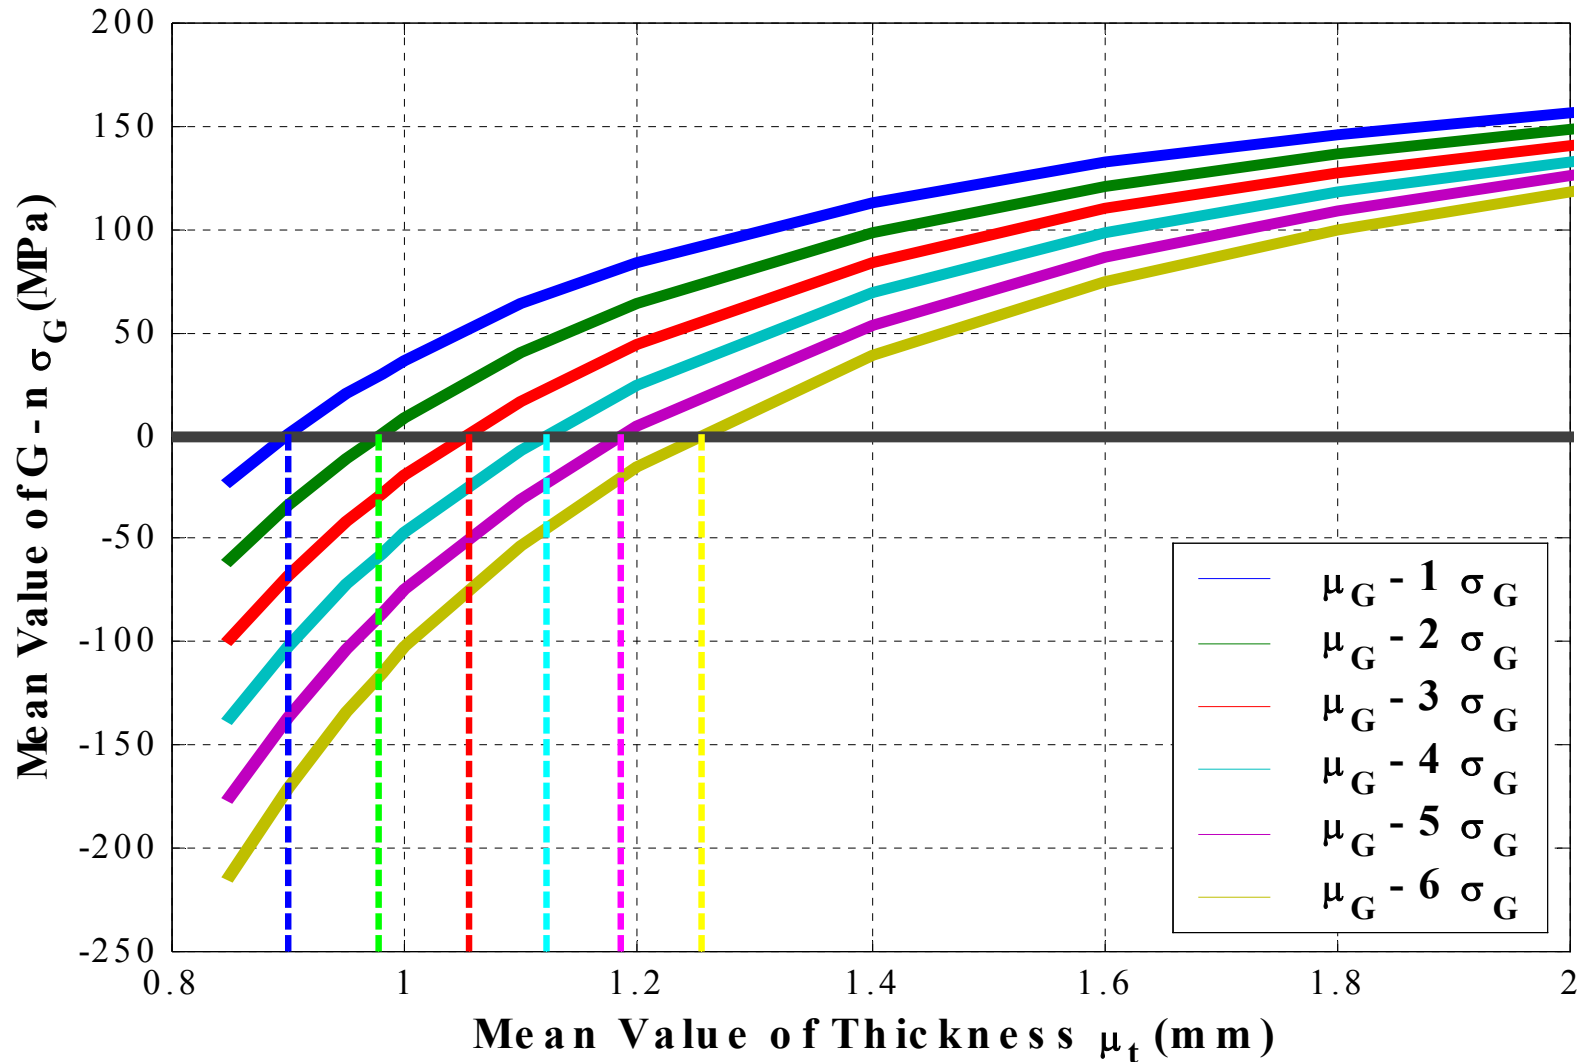

Workflow for Robust Design System

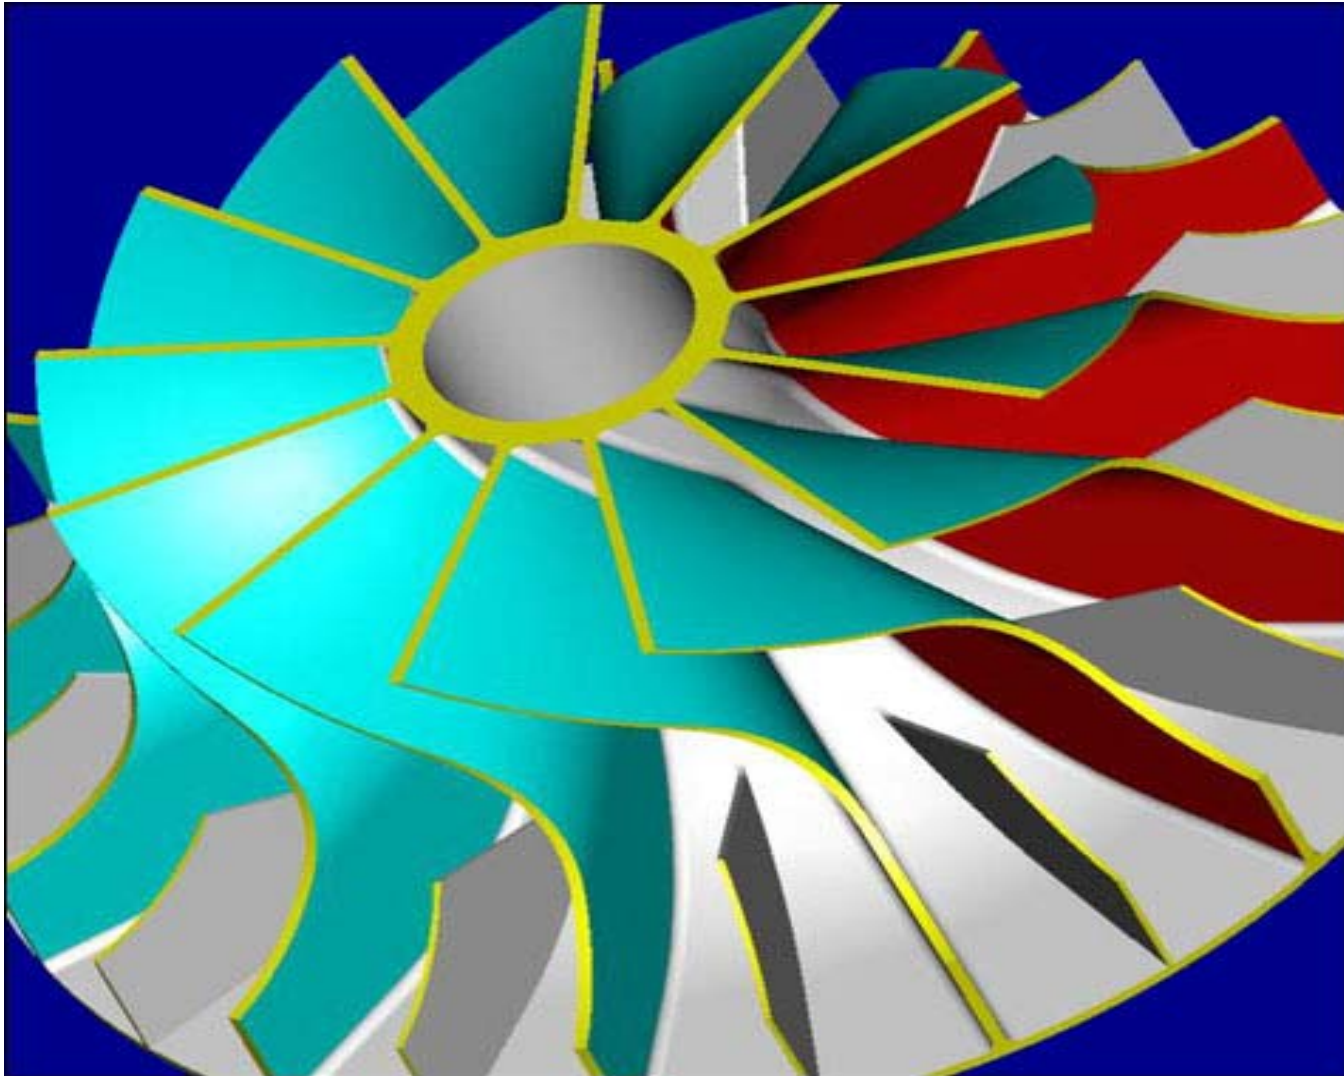

Design Variable selection that meets desired quality criteria

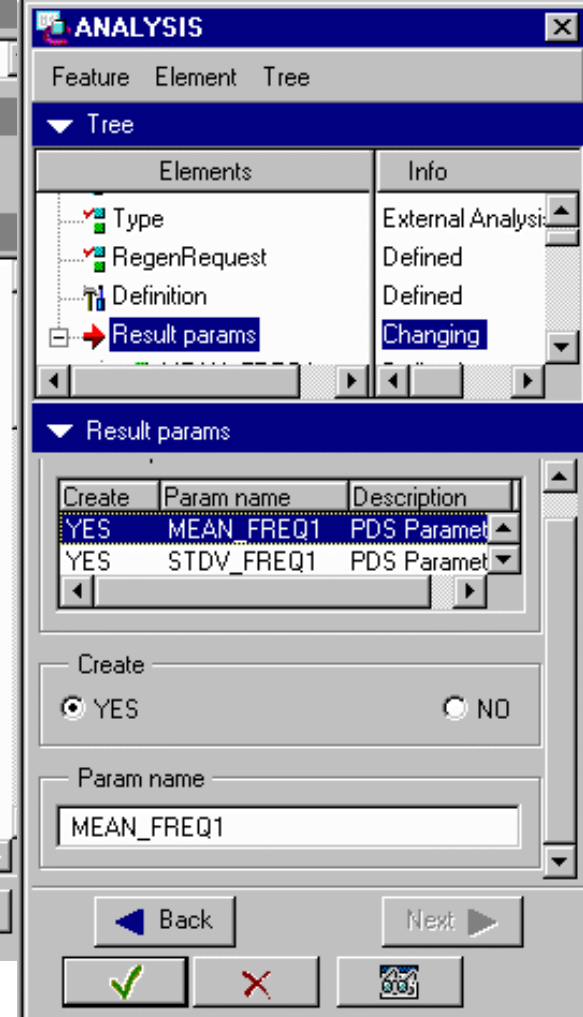

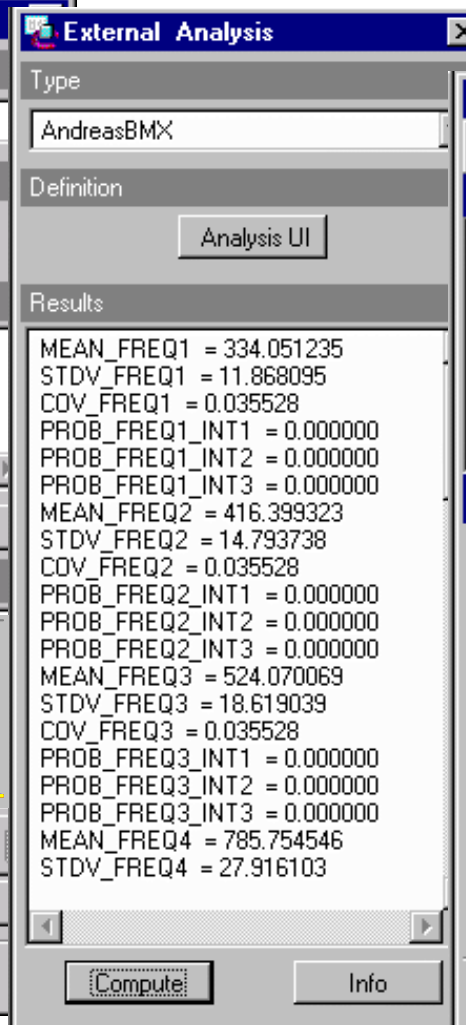

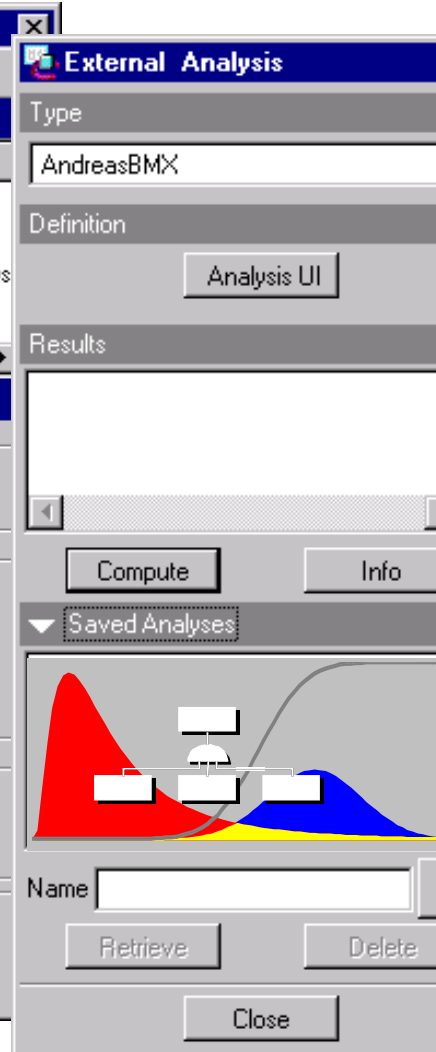

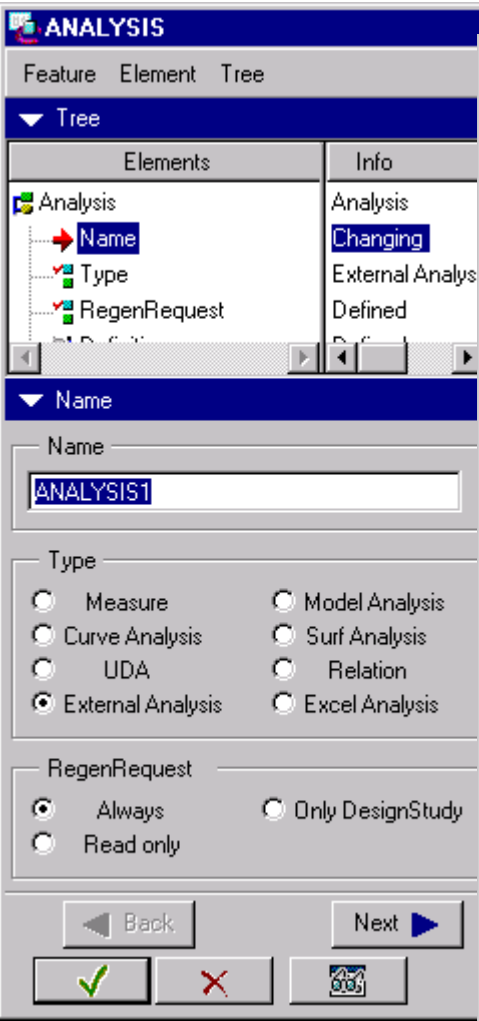

Performance Function $G = \sigma_{ult} - \sigma_{max}$

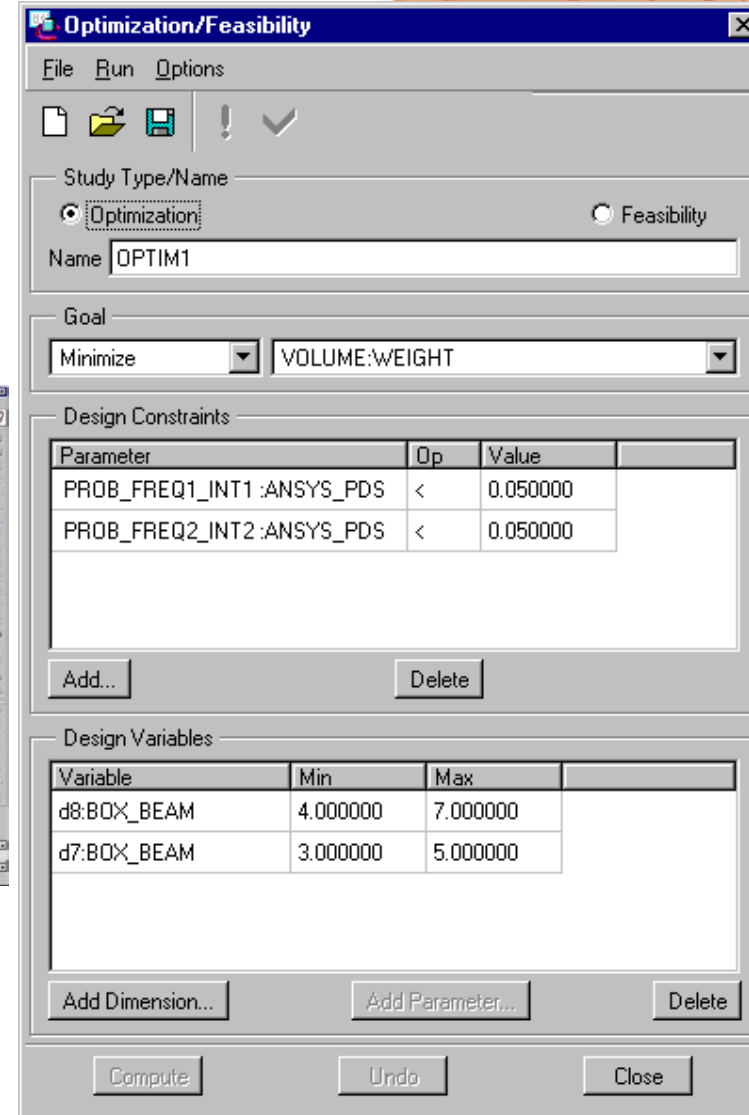

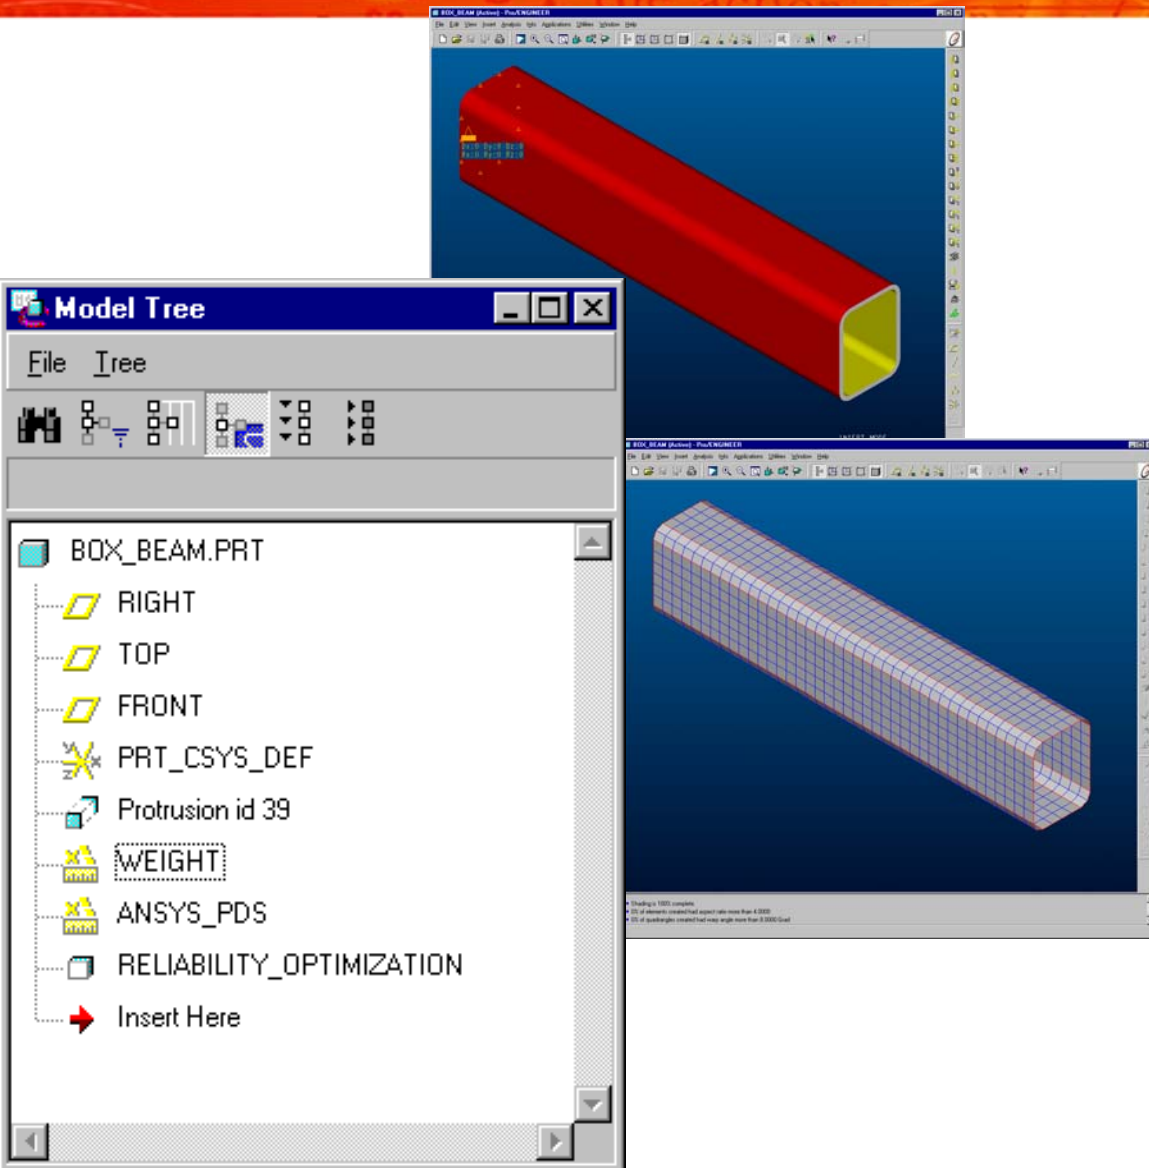

PDS for CAD Design Variables

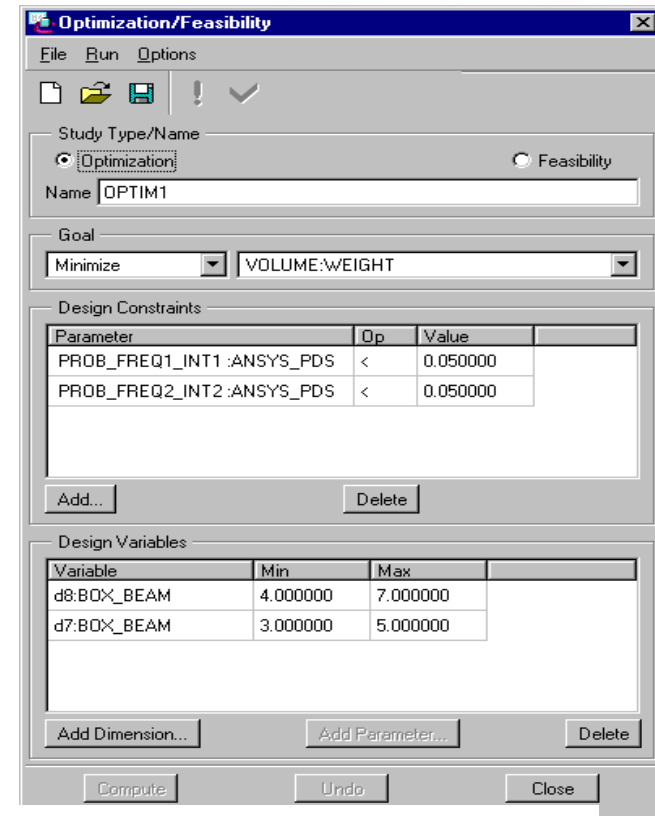

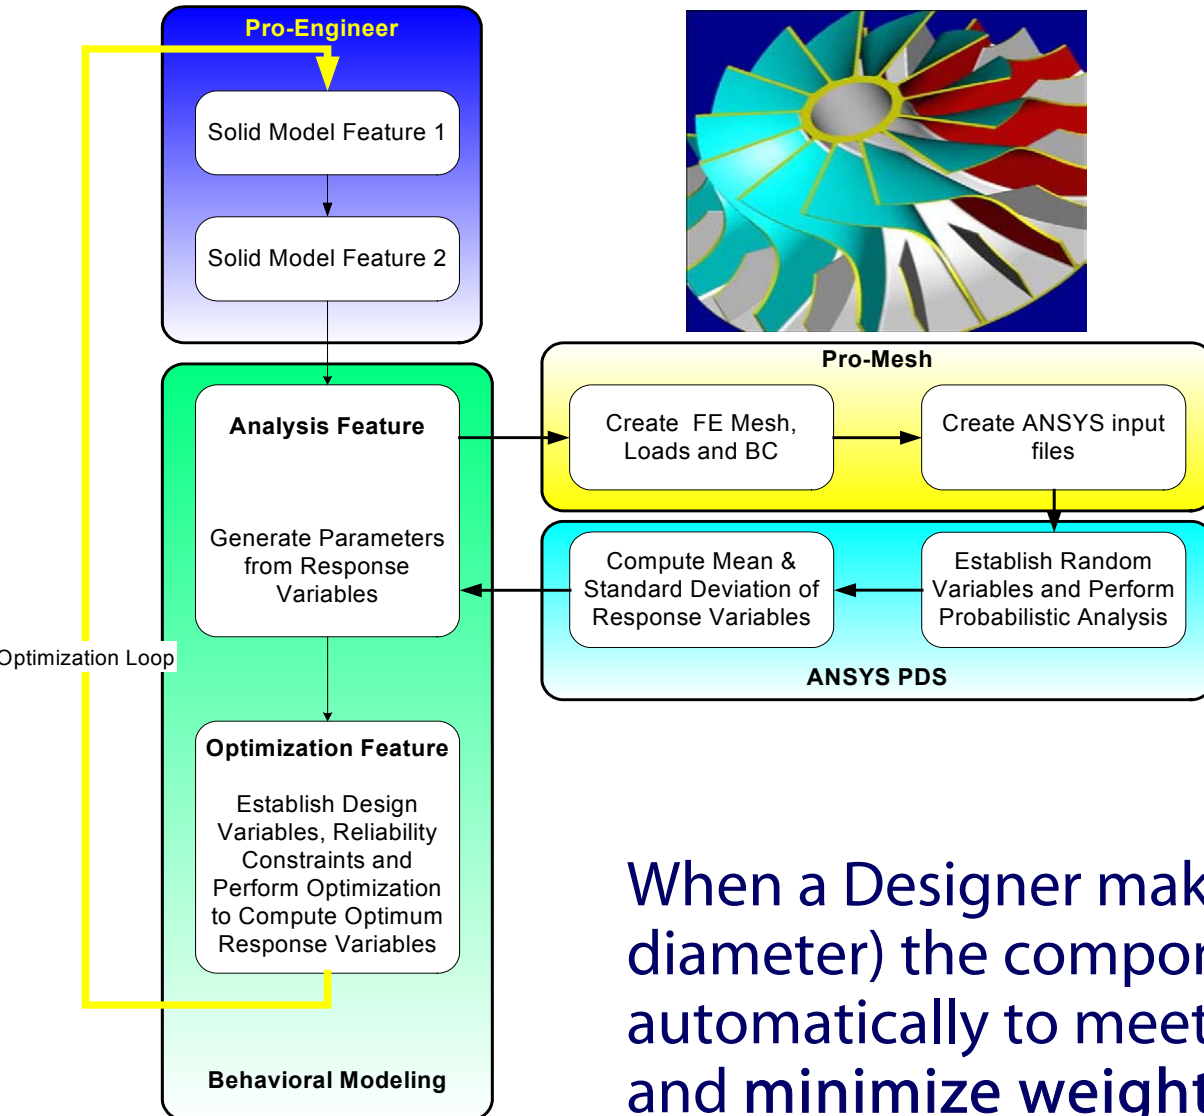

Behavioral Modeling External Analysis – ANSYS_PDS

BMX External Analysis & Optimization Features

Reliability Based Optimization within Pro/Engineer

When a Designer makes a change (i.e. hole diameter) the component thickness updates automatically to meet desired quality criteria and minimize weight

Conclusions

- Reliability Based Optimization within Pro/Engineer using ANSYS PDS is available today
- CAD designs automatically meet desired quality criteria and minimize weight
- Probabilistic Durability Modeling of Manufacturing Variations coupled with optimization can avoid over-design (deterministic analysis)
- Introduction of Probabilistic analysis in the design process can reduce component weight by 17%
